Anurag Sajwan

AI / Generative AI Engineer

Dehradun, India • +91 6398679318 • anuragsajwan888@gmail.com • LinkedIn • GitHub

SUMMARY

AI/ML Engineer with 1+ years of experience building production Generative AI and agentic systems for enterprise operations — RAG pipelines, LLM-powered automation, and real-time monitoring. Cut manual review effort by 95% and ledger-selection effort by 85% at RIMSPL, and now automate ~3,300 client bills a month, fleet alerts, and lab reports at MPCC. Hands-on with Python, FastAPI, LangChain/LangGraph, MCP, pgvector, Docker, and NVIDIA NIM.

SKILLS

Languages Python, SQL
GenAI & Agents LangChain, LangGraph, LlamaIndex (LlamaParse), MCP, OpenAI API, NVIDIA NIM, RAG, Agentic Workflows, Prompt Engineering, HuggingFace Transformers
ML & NLP PyTorch, Scikit-learn, Text Classification, Word Embeddings, Anomaly Detection, Pandas, NumPy
Vector Databases pgvector, Pinecone, ChromaDB, Semantic Search, Embedding Pipelines
Backend & MLOps FastAPI, REST APIs, PostgreSQL, Docker, CI/CD, Git, AWS, Model Evaluation, LLM Monitoring, Hallucination Detection
Automation & Integrations WhatsApp/Email Automation, Real-time Data Monitoring, Alerting Workflows, Enterprise System Integration

EXPERIENCE

AI Engineer — MPCC Sept 2026 – Present

- Automated delivery of ~3,300 client bills per month over WhatsApp and email, replacing in-person delivery that took 15–20 employees and eliminating the fuel and travel costs.
- Built a real-time AI fleet-monitoring agent on live GPS and fuel-sensor REST APIs (35 vehicles, ~70 drivers, 40 hospital checkpoints per vehicle) that matches positions to checkpoint locations and alerts staff within 1 minute of a missed stop, replacing full-day manual monitoring; also flags fuel theft through sudden fuel-drop detection.
- Built an AI report-delivery module inside the lab management website, sending 100–120 lab reports per day to registered clients over WhatsApp.

AI Agents & Applications Developer — RIMSPL July 2025 – June 2026

- Built and maintained AI infrastructure for an internal enterprise platform automating workflows across mining logistics and financial auditing.
- Architected an MCP-based agentic monitoring system in Python and FastAPI that automated data auditing across 15 enterprise operational modules, reducing manual review effort by 95% and enabling real-time anomaly detection across fleet, logistics, and financial workflows.
- Built a hybrid AI-powered Ledger Automation System using FastAPI, PostgreSQL, and pgvector, combining semantic similarity search over vector-embedded transaction descriptions with deterministic accounting rules to recommend top Debit/Credit ledger matches; implemented a human-in-the-loop approval workflow where accountant feedback is written back to the vector store for continuous improvement, reducing manual ledger selection effort by 85%.
- Used LlamaIndex's LlamaParse to extract and structure raw transaction and ledger documents (PDFs) into clean input, reducing the volume of raw text passed to the LLM and cutting inference cost before downstream RAG scoring.

AI/ML Engineer Intern — Cynoteck Technology Solutions Mar 2025 – Jun 2025

- Cleaned and prepared raw text data for machine learning models; applied feature engineering techniques including TF-IDF and word embeddings to convert text into model-ready format.
- Trained and compared ML models (Logistic Regression, SVM) for text classification tasks; gained hands-on exposure to BERT and HuggingFace Transformers in a production team environment.

PROJECTS

AI Job Search Agent - Link Python • FastAPI • Playwright • NVIDIA NIM • ChromaDB • RAG • SQLite

- Built an autonomous agent that scrapes LinkedIn, Naukri, and Indeed daily using Playwright with saved sessions to bypass bot detection.
- Two-tier matching engine — local embeddings for fast vector pre-filtering, then NVIDIA NIM LLM scoring against resume chunks in ChromaDB — with deduplication, ranking, and a styled HTML email digest including match rationale and skill-gap analysis.

Medical AI Assistant - Link Python • FastAPI • LangGraph • LangChain • React • PostgreSQL • PGVector • NVIDIA NIM

- Architected a full-stack clinical assistant using LangGraph's ReAct agent (Think → Act → Observe) with 4 custom tools — patient search, semantic search, report summarization, and visit history — answering doctors' natural-language queries in real time.
- Built a RAG pipeline with PGVector cosine search over 1024-dim NVIDIA NeMo embeddings and a custom sentence-aware chunker for sub-second retrieval across thousands of transcriptions; added a streaming React/SSE interface with an LLM guardrail layer that blocks non-medical prompts and prompt injection.

EDUCATION

B.Tech, Computer Science Engineering — DIT University, Dehradun 2021 – 2025

CERTIFICATIONS

AI for everyone • Introduction to Deep Learning & Neural Networks with Keras • Python for Data Science, AI & Development
